

A cool demo

whats the deal with demos?

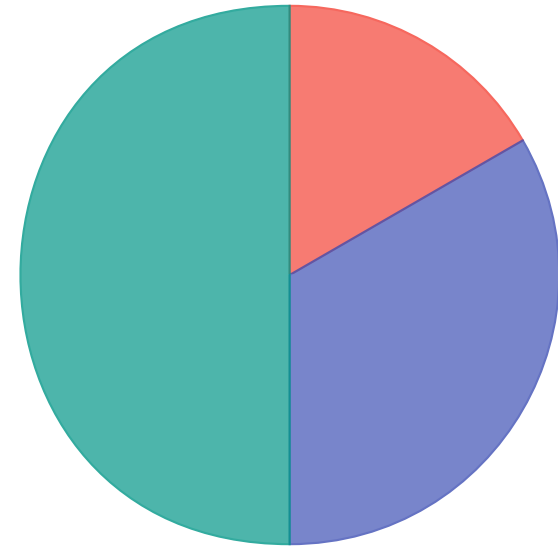

The `<hr />` elements (represented by - - - in md) create new `<sections>` in the rendered html which allows easier layouts of pages in a presentation.

pie chart also

Normally you get a new `<article>` with each top level heading and a `<section>` with each second level heading but in a presentation you might not want so many subheadings.

foo
bar
baz

some important data

and maybe a table

*this page simply has a blockquote
and a table*

name	default	description
address	https://google.com	the address of the page
value	1	the value of the page
autorization	none	the authorization (of the page)
timeout	5s	the time out, of the page

A sick slide with the code on the left

```
def main():  
    print("hello world!")  
  
if __name__ == "__main__":  
    main()
```

hello-world.py

This is some code you can take home and study.
